Preliminary Deposit-Type Map of Northwestern Mexico

Kenneth R. Leonard

Introduction

The following map and descriptions contain site-specific geologic and economic data on mineral deposits and occurrences in Sonora, North Baja California, South Baja California and the northern part of Chihuahua, Mexico. The area is important for the evaluation of mineral deposits in the United States because many major mineral deposit trends extend across the U.S.-Mexican border.

The data was compiled from both Spanish- and English-language sources, and was entered into a microcomputer database known as MEX-MRDS.¹ The database consists of 753 records of mines, prospects, and mineral occurrences in northwest Mexico. A record may refer to one deposit or to a group of several closely-spaced deposits of similar character. Each record may contain up to 104 individual data fields which include available information on location, commodities, geology and economic potential of the deposit(s). Thirty-nine of these data fields were used in compiling the site descriptions listed in this report

The symbols shown on the map correspond to 52 deposit type classifications, including one "not classified" group. Deposit types closely follow those listed in U.S. Geological Survey Bulletin 1693, Mineral Deposit Models (Cox and Singer, 1986). In addition to these, twenty one deposit-type designations were created in order to allow classification of deposits which did not fit any of the models listed in Cox and Singer (1986). The deposit type classifications used in this report should be considered only as broad categories of deposits which occur in similar geologic settings. Deposits grouped under one type may show considerable variation in detail.

Explanation of Data Fields

MRDS RECORD NUMBER

Unique number assigned to each record in the database. A record may refer to one deposit or to a group of closely-spaced deposits. Two district records have been included (MX00018 and MX02161) in order to include data that cannot be subdivided on a site-by-site basis.

MAP NUMBER

Number used to identify symbol on map that corresponds to the site description. Same as the last 4 digits of the MRDS number.

¹MEX-MRDS was created by Don Huber (USGS) as a modification of a program developed by Paul Schruben (USGS) which utilizes the database applications environment Revelation. For information regarding public access to the database, contact Don Huber, Branch of Resource Analysis, U.S. Geological Survey, MS 984, 345 Middlefield Rd., Menlo Park, CA 94025. (415) 329-5358.

SITE NAME

Most commonly used name used in the literature to identify the site. In some cases, this may be the name of a nearby town or geographic feature.

SYNONYM NAME

Less commonly used names for the site, names of several closely-spaced mines that have been included in one record, or names of individual orebodies.

DISTRICT/AREA

Informal district name used in the literature. Names appearing after a slash (/) refer to municipalities.

STATE

Mexican state in which the site is located: Sonora, North Baja California (NBAJA), South Baja California (SBAJA), or Chihuahua.

LATITUDE/LONGITUDE

Geodetic coordinates for the site. Locations listed with no seconds entered (e.g. 28-28- N, not 28-28-00N) are estimated to the nearest minute.

COMMODITIES

Metallic commodities are listed by their chemical symbol (AU = gold, Pb = lead, etc.). Non-metallic commodities are listed as follows:

ASB	asbestos	LST	limestone
B	borates	MG	magnesite
BA	barite	NA	sodium compounds
BRI	brine	P	phosphates
C	coal	QTZ	quartz
F	fluorite	TLC	talc
GRF	graphite	VRM	vermiculite
GYP	gypsum	ZEO	zeolites

MAJOR/MINOR/POTEN

Subdivision of commodities field for sites that have recorded production.

MAJOR: Commodity of primary economic interest.

MINOR: Coproducts or byproducts of mining.

POTEN: Commodities that have not been exploited, but which are present in sufficient amounts to be of possible economic interest.

MAIN/MINOR

Subdivision of commodities field for sites that do not have recorded production, or for which production is uncertain.

OCCUR

Commodities present in small amounts and which have no known economic importance or potential.

ORE MATERIALS

Mineralogical composition of the ore. Generally includes metallic minerals which may not contain any commodities of primary interest, but which are

intimately associated with ore grade mineralization. Minerals that appear in parentheses are present in very small amounts.

GENERAL ANALYTICAL DATA

Assays, geochemical findings, grade information or other pertinent analytical data.

PRODUCTION

Amount of commodity produced in terms of size classification scheme devised by Guild (1981). See Table 1. Codes used are as follows:

L = Large	Y = Yes (amount unknown)
M = Medium	N = No
S = Small	U = Uncertain

EXPLORATION/DEVELOPMENT COMMENTS

Description of past or recent activity at the site

DEPOSIT MODEL

General classification of deposit based on mineralogic characteristics, geologic occurrence and morphology.

The 52 Deposit Classes recognized in the map area are:

I. Models listed in USGS Bulletin 1693 (Cox and Singer, 1986)

Cu Skarn	Kuroko Massive Sulfide
Pb-Zn Skarn	Simple Sb
Fe Skarn	Polymetallic Replacement
Volcanic-Hosted Magnetite	Polymetallic Vein
Au-Ag-Te Vein	Podiform Chromite
Comstock Epithermal Vein	Serpentine-Hosted Asbestos
Creede Epithermal Vein	Carbonate-Hosted Au
Sado Epithermal Vein	Flat-Fault Au
Hot-Spring Au	Porphyry Cu
Low-Sulfide Au	Porphyry Cu, Skarn-Related
Epithermal Mn	Porphyry Cu-Mo
Replacement Mn	Porphyry Mo, Low F
Sedimentary Mn	Placer Au
Volcanogenic Mn	Bedded Barite
W Skarn	Upwelling -type P
Basaltic Cu	

II. Deposit classifications added by author.

Not Classified	Amorphous Graphite
Au Skarn	Disseminated Graphite
Epithermal Au-Ag Vein	Bedded Gypsum
W Pegmatite Vein	Coal
Serpentine-Hosted Magnesite	Evaporite Na
Serpentine-Hosted Talc	Trona
Carbonate-Hosted U	Salt
Volcanic-Hosted U	Fluorite Vein
Lithium Pegmatite	Limestone
Vermiculite	Quartz
Stratiform Borates	

USGS MODEL NUMBER

The number corresponding to the appropriate model for those deposits which fit one of the models listed in USGS Bulletin 1693. Deposits classified as Epithermal Au-Ag Veins have been given the number 25?, indicating the author's belief that, given more information, these deposits could probably be assigned to one of the models listed in Bulletin 1693 as 25a, b, c, or d.

DEPOSIT SIZE

Estimated total tonnage of past production plus estimated reserves. Classified in terms of size classification scheme devised by Guild (1981). See Table 1.

Codes used are as follows:

L = Large
M = Medium
S = Small

DEPOSIT DESCRIPTION

Summary of data pertaining to deposit morphology, mineralogy, dimensions, and geologic environment, given in narrative form.

HOST ROCK AGE

Codes used are as follows:

QUAT	Quaternary	CARB	Carboniferous
HOLO	Holocene	PENN	Pennsylvanian
PLEIS	Pleistocene	MISS	Mississippian
TERT	Tertiary	DEV	Devonian
PLIO	Pliocene	SIL	Silurian
MIO	Miocene	ORD	Ordovician
OLIGO	Oligocene	CAMB	Cambrian
EO	Eocene	PREC	Precambrian
PALEO	Paleocene	CEN	Cenozoic
CRET	Cretaceous	MES	Mesozoic
JUR	Jurassic	PAL	Paleozoic
TRI	Triassic	E	Early
PERM	Permian	L	Late

HOST ROCK TYPE

Lithologic name of rock unit(s) containing mineralization.

IGNEOUS UNIT AGE

See Host Rock Age.

IGNEOUS UNIT TYPE

Lithologic name of igneous rock unit(s) associated with mineralization.

GANGUE MINERALS

Mineralogy of non-economic component of ore.

SIGNIFICANT ALTERATION

Description of alteration patterns, or list of types of alteration associated with mineralization.

REFERENCES

List of sources arranged alphabetically by author and year of publication.

PRODUCTION TABLES

Amount of commodities or ore produced in a given year or range of years. Production figures are listed in the same units as given in the source publication.

ITEM: Ore, concentrates, or commodity.

TONNAGE($\times 10^3$): Amount of production given in thousand units (e.g. 100 MT = 100,000 metric tonnes). Abbreviations for units are:

MT = metric tonnes

LT = long tons

ST = short tons

TONS = unable to determine whether MT, ST, or LT.

LB = pounds

KG = kilograms

TPD = tons/day

TPY = tons/year

YEAR(S): Year or range of years during which production took place. A year followed by a hyphen (e.g. 1943-) indicates production after that year. Likewise, a year preceded by a hyphen (-1953) indicates production before that year. In some cases, this will be the date of the source publication for the production data. Dates given are inclusive.

GRADE: Grade of the ore or concentrate. In some places where contained metal is listed, this column contains the amount of ore from which the metal was recovered and from which a grade can be calculated.

PRODUCTION COMMENTS

Additional descriptive information about the data. Comments may be keyed to particular lines in a table, designated as Items 1 through n , with Item 1 being the top line and Item n the n th line from the top.

SOURCE OF PRODUCTION INFORMATION

References containing the production data. These are often keyed to particular lines in a table, in a manner identical to the comments field.

RESERVES/POTENTIAL RESOURCES TABLES

The amount of unmined material remaining in the deposit. Reserves are identified deposits whose quality and quantity have been estimated by: 1) geochemical analyses and physical measurements through drill holes, underground workings or other means ("measured ore"), 2) sampling data with projections based on geologic evidence ("indicated ore"), or 3) use of reasonable geologic inferences only ("inferred ore"). The mining industry terms "proven", "probable", and "possible", and other less specific terms have been reported as they appear in the literature. Data listed under Potential Resources reflect a lesser degree of certainty. These estimates are generally based on designations of permissive terrane and on little or no hard data.

ITEM: Ore or commodity.

TONNAGE($\times 10^3$): Amount of reserves or potential resources given in thousand units (e.g. 100 MT = 100,000 metric tonnes). Abbreviations for units are listed above.

YEAR: Date of the estimate.

GRADE: Grade of the ore.

RESERVES/POTENTIAL RESOURCES COMMENTS

Additional descriptive information about the data. Comments may be keyed to particular lines in a table, designated as Items 1 through n , with Item 1 being the top line and Item n the n th line from the top.

SOURCE OF RESERVES/POTENTIAL RESOURCES INFORMATION

References containing the reserves or potential resources data. These are often keyed to particular lines in a table, in a manner identical to the comments field.

Acknowledgements

This project was initiated at the request of Glenn Alcott and implemented under the supervision of Norm Page. Thanks are due to Don Huber for invaluable lessons in the care and feeding of databases, to John-Mark Staude for his guidance at the beginning of the project, and to Jack Stewart, to whom fell the ominous task of reviewing this document.

TABLE 1. Size categories, in metric tonnes of metal or commodity unless otherwise specified. Numbers represent total past production + reserves.

	Large	>	Medium	>	Small
Antimony		50,000		5,000	
Asbestos		10,000,000		100,000	
Barite (BaSO ₄)		5,000,000		50,000	
Beryllium (BeO)		1,000		10	
Boron (B ₂ O ₃)		10,000,000		100,000	
Chromium (Cr ₂ O ₃)		1,000,000		10,000	
Cobalt		20,000		1,000	
Copper		1,000,000		50,000	
Fluorite (CaF ₂)		5,000,000		50,000	
Gold		500		25	
Graphite		1,000,000		10,000	
Gypsum		100,000,000		5,000,000	
Iron (ore)		100,000,000		5,000,000	
Lead		1,000,000		50,000	
Lithium (Li ₂ O)		100,000		10,000	
Magnesium (MgCO ₃)		10,000,000		100,000	
Manganese (tons of 40% Mn)		10,000,000		100,000	
Mercury (flasks)		500,000		10,000	
Molybdenum		500,000		5,000	
Nickel		500,000		25,000	
Phosphate (P ₂ O ₅)		200,000,000		200,000	
Platinum Group		500		25	
Rare Earths (RE ₂ O ₃)		1,000,000		1,000	
Silver		10,000		500	
Sodium (salts)		10,000,000		1,000,000	
Sulfur		10,000,000		100,000	
Talc		10,000,000		1,000,000	
Thorium		10,000		1,000	
Tin		100,000		5,000	
Tungsten		10,000		500	
Uranium		10,000		100	
Vanadium		10,000		500	
Zinc		1,000,000		50,000

Site Descriptions

MRDS RECORD NUMBER...MX00001

MAP NUMBER.....1
 SITE NAME.....El Tordillo
 DISTRICT/AREA...../El Realito
 STATE.....SONORA
 LATITUDE.....28-23- N LONGITUDE.....109-39- W
 COMMODITIES.....W MO
 MAIN...W MO
 ORE MATERIALS.....scheelite, molybdenite
 DEPOSIT MODEL.....W Pegmatite(?)
 DEPOSIT SIZE.....SMALL
 DEPOSIT DESCRIPTION.....Euhedral scheelite and flakes of
 molybdenite in weakly sericitized quartz-monzonitic granite, on
 the border of a body of leucocratic granite (Radelli, 1985).
 HOST ROCK AGE.....LCRET-ETERT
 HOST ROCK TYPE.....quartz-monzonitic granite
 IGNEOUS ROCK AGE.....LCRET-ETERT
 IGNEOUS ROCK TYPE.....granitic intrusive complex
 SIGNIFICANT ALTERATION.....sericitic
 REFERENCE...Radelli, 1985.

MRDS RECORD NUMBER...MX00002

MAP NUMBER.....2
 SITE NAME.....Cananea
 SYNONYM NAME.....Sonora Hill
 DISTRICT/AREA.....Cananea
 STATE.....SONORA
 LATITUDE.....30-57-15N LONGITUDE.....110-19-00W
 COMMODITIES.....CU MO AG
 MAJOR....CU MINOR....MO AG
 ORE MATERIALS.....chalcocite, pyrite, chalcopyrite,
 covellite, molybdenite
 PRODUCTION.....L
 EXPLORATION AND DEVELOPMENT COMMENTS.....At the end of 1985: plans
 announced to increase mining capacity to 300,000 TPD (ore + waste)
 with concentrator throughput of 80,000 TPD. Low-grade ore being
 stockpiled for treatment in 22,000 TPY solvent
 extraction/electrowin plant; Mining Journal, v. 305, p. 484.
 DEPOSIT MODEL.....Porphyry Cu
 USGS MODEL NUMBER.....17
 DEPOSIT SIZE.....LARGE
 DEPOSIT DESCRIPTION.....Disseminated primary and supergene Cu ore
 associated with a NW-trending series of quartz porphyry plugs in
 Mesa volcanics. Breccia pipes and porphyry-volcanic contact zones
 both favorable sites for mineralization. Primary ore consists of
 pyrite-chalcopyrite and minor molybdenite in quartz-alunite
 gangue. Supergene chalcocite (+ minor covellite) zone overlies
 extensive chalcopyrite zone.
 HOST ROCK AGE.....LCRET
 HOST ROCK TYPE.....dominantly andesitic volcanics
 IGNEOUS ROCK AGE.....LCRET-ETERT
 IGNEOUS ROCK TYPE.....granodioritic to quartz monzonitic
 porphyries
 GANGUE MINERALS.....quartz, alunite, tourmaline

SIGNIFICANT ALTERATION.....Intense quartz-sericite-pyrite alteration grades outwardly into propylitic alteration at distances of about 250 M from quartz porphyry contacts. Evidence of "enveloping" of the pyritic-phyllitic zone indicates overlaying of mineralizing centers caused by progressive multiple intrusive effects.

COMMODITIES.....SB AG AU

MAJOR.....SB MINOR.....AG AU

ORE MATERIALS.....antimony oxides, minor stibnite; silver
salts, native gold

PRODUCTION.....L

EXPLORATION AND DEVELOPMENT COMMENTS.....District has been mined
for 200 years. In 1882, a Boston company started exploration
project on three vein systems in attempt to mine high-grade
argentite, mainly at the San Jose and La Argentina mine. Maximum
depth of workings in early mining period was about 10 M. Largest
producers in early days: La Argentina, San Miguel and San Jose. In
1924-1930: La Argentina, La Montana, El Promontorio and San
Francisco. Late 1930's to 1942: La Montana, El Palo Verde, La
Limena, El Pensamiento, San Francisco and La Fortuna. After 1942:
La Piedra Azul.

DEPOSIT MODEL.....Simple Sb

DEPOSIT SIZE.....MEDIUM

DEPOSIT DESCRIPTION.....Hundreds of antimony veins found in
district, most of no economic import. 30+ veins have been mined to
considerable extent. Veins predominantly consist of coarse-grained
milky-white quartz (except Piedra Azul mine, where gangue is fine-
grained chalcedony.) Veins in productive mines average 30 CM in
width and 100 M in length. (Max width: 3 M, Max length: 500 M.)
Thoroughly oxidized ore consists mainly of antimony oxides of
variable color. Primary stibnite rare. Ag salts (esp. Ag-bromides)
and native Au occur locally in the ore. Antimony ore forms
irregular high -grade bodies in quartz (and chalcedony) veins,
concentrations along vein walls, and low-grade disseminations
throughout veins. Largest ore bodies probably contained up to 1000
tons of (high-grade) shipping ore, but average content for all
mines was probably less than 50 tonnes. Most ore bodies less than
50 M long, 15 M deep and 2.5 M wide.

HOST ROCK AGE.....TRI-EJUR

HOST ROCK TYPE.....red calcareous sandstone and siltstone
with interbedded calcareous sandstone, limestone, and
conglomerate.

IGNEOUS ROCK AGE.....TERT?

IGNEOUS ROCK TYPE.....quartz porphyry, fine-grained diorite,
trachyte

GANGUE MINERALS.....quartz, chalcedony

MAJOR.....CU POTEN.....MO OCCUR.....U

ORE MATERIALS.....chalcocite, covellite, chalcopyrite,
cuprite, tenorite, chrysocolla, malachite, azurite; minor
molybdenite; (metatorbernite)

PRODUCTION.....S

EXPLORATION AND DEVELOPMENT COMMENTS.....In-situ lixiviation study
underway in 1985.

DEPOSIT MODEL.....Porphyry Cu

USGS MODEL NUMBER.....17

DEPOSIT SIZE.....MEDIUM

DEPOSIT DESCRIPTION.....Mineralized breccia pipe, probably part of
a deeply buried porphyry system. Cu minerals occur as cavity
fillings in collapse breccia. Cu mineralization consists of 65%
chalcocite-covellite, 15% chalcopyrite, 10% cuprite-tenorite, and
10% chrysocolla-malachite-azurite. Minor molybdenite.
Metatorbernite occurrence. Oxidation minerals: goethite,
malachite, chrysocolla, hematite, limonite, pitch, and neotoctite.
Hypogene minerals: specularite, pyrite, quartz, siderite,
magnetite, chalcopyrite, sericite, barite, orthoclase. Pervasive
hydrothermal alteration. Published sources indicate host rock as
Triassic-Jurassic quartzite Recent work suggests host rock may be
pre-Triassic, and possibly as old as Ordovician. (J. Stewart,
writ. comm., 10-13-88).

HOST ROCK AGE.....ORD?

HOST ROCK TYPE.....quartzite

IGNEOUS ROCK AGE.....PALEO (57.4 +/- 1.4 M.Y., MICRODIORITE)

IGNEOUS ROCK TYPE.....andesite (microdiorite), dacite porphyry

GANGUE MINERALS.....specularite, pyrite, quartz, siderite,
magnetite, sericite, barite, orthoclase

SIGNIFICANT ALTERATION.....Considerable argillic and silicic
alteration within breccia pipe. Peripheral chlorite-epidote-
calcite-pyrite-specularite assemblage.

ORE MATERIALS.....disseminated gold
GENERAL ANALYTICAL DATA.....Samples from zones of intersection of
 fault systems ran as high as 50 g/MT Au, Au:Ag < 1, over 3-5 m
 widths (Silberman, et.al., 1987).
PRODUCTION.....S
EXPLORATION AND DEVELOPMENT COMMENTS.....Government sponsored
 projects to study mineral deposits in 1981, 1982, and 1984. Some
 small-scale mining.
DEPOSIT MODEL.....Hot-Spring Au-Ag
USGS MODEL NUMBER.....25a
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Gold-silver mineralization associated with
 fluorite in fractured, partially silicified rhyolite containing
 thin quartz veins. Several types of fault-controlled hydrothermal
 breccias occur; 1> "crackle breccia"-in situ hydrofracturing of
 silicified or argillized wall rock with no significant translation
 of fragments, 2> quartz-hematite-adularia breccia veins
 crosscutting fractured wall rock and containing silicified or
 argillized clasts, 3> clast supported breccia with considerable
 open space, limonite and/or hematite, and quartz, and 4> quartz-
 matrix breccia containing disseminated sulfides which oxidize to
 concentrations of limonite and/or hematite. The mineralization has
 occured along fractures controlled by three 2-3 km long
 subparallel normal faults 600 m apart. Assay data show that the
 highest concentrations of gold, fluorite, and silver occur in
 brecciated fault zones, particularly at the intersection of two
 prominent fault systems trending NW and NE respectively.
HOST ROCK TYPE.....rhyolite
IGNEOUS ROCK AGE.....ECRET
IGNEOUS ROCK TYPE.....rhyolite
GANGUE MINERALS.....quartz, fluorite, chlorite,
 montmorillonite, kaolinite, adularia, hematite/limonite, garnet
SIGNIFICANT ALTERATION.....Widespread potassic and silicic
 alteration, most intense along fractures. Central argillic,
 peripheral propylitic, and near-surface kaolinitic alteration.
 Coarse euhedral andradite at the SE end of the dome suggests early
 thermal metamorphism. Chlorite, montmorillonite, and kaolinite
 present as alteration products. Fluorite abundant in the mine
 openings and faulted areas.

 ORE MATERIALS.....gold
 GENERAL ANALYTICAL DATA.....2-6 g/MT Au found along detachment
 surface, 3-4 g/MT Au in quartz-hematite veins. Widespread lower
 grade Au.
 PRODUCTION.....S
 EXPLORATION AND DEVELOPMENT COMMENTS.....Area was the site of a
 small gold operation, and is surrounded by placer workings in
 adjacent alluvium. Anaconda drilled several cores in 1985.
 DEPOSIT MODEL.....Flat-Fault Au
 USGS MODEL NUMBER.....37b
 DEPOSIT SIZE.....SMALL
 DEPOSIT DESCRIPTION.....Gold mineralization along complex
 detachment surface separating lower plate porphyritic granite,
 which is sericitically altered, brecciated and silicified, from
 unmineralized upper plate of coarse-grained biotite granite. Low
 angle fault marked by intensely sheared, oxidized zone, 1-3 m
 thick, containing abundant hematite, minor silicification and
 discontinuous quartz veins. Fault zone splays into hanging wall
 locally. Gold also found in quartz-hematite breccia veins cutting
 both upper and lower plate rocks. Bulldozer trnches made by
 Anaconda in 1984 exposed stockwork of irregular Au-bearing quartz
 veinlets over 75 by 200 m area in sericitized granite.
 HOST ROCK AGE.....ETERT?
 HOST ROCK TYPE.....porphyritic granite-aplite
 IGNEOUS ROCK AGE.....LCRET?
 IGNEOUS ROCK TYPE.....biotite granite, aplite
 GANGUE MINERALS.....quartz; iron and lead oxides
 SIGNIFICANT ALTERATION.....Sericitization common, though grade best
 indicated by presence of chlorite and hematite.

 DEPOSIT MODEL.....Porphyry Cu
 USGS MODEL NUMBER.....17
 DEPOSIT SIZE.....LARGE
 DEPOSIT DESCRIPTION.....Metamorphosed porphyry copper deposit.
 Primary mineralization consists of pyrite, chalcopyrite, bornite,
 molybdenite, minor magnetite and gold disseminated in fractures
 and in quartz-Kspar-calcite-chlorite-epidote veinlets (@3 mm
 wide). Pyrite:chalcopyrite ratio 1.3 to 1 in central core, with
 internal subzones of 0.5 to 1. Grades outward to 14:1 in pyritic
 halo surrounding QMP intrusive. Capped by goethite layer averaging
 40 M thick (max. 60 M). Oxidation minerals: chrysocolla, goethite,
 hematite, clay minerals, neotocite, diopside and malachite. High-
 grade transition zone 9 M thick below oxide zone contains bornite,
 chalcocite, covellite, digenite, cuprite and native Cu. Limited
 distribution of gold.
 HOST ROCK AGE.....LJUR-ECRET

HOST ROCK TYPE.....andesite porphyry and breccia
 IGNEOUS ROCK AGE.....ECRET (107 M.Y., QMP)
 IGNEOUS ROCK TYPE.....quartz monzodiorite porphyry, post-min.
 diabase dikes
 GANGUE MINERALS.....chlorite, epidote, calcite, quartz,
 albite, feldspar, sericite, rare biotite, trace axinite
 SIGNIFICANT ALTERATION.....Zoned outwardly: silicic core ringed by
 potassic and propylitic alteration zones and pyrite halo. No
 sericitic (phyllic) alteration present.

melaconite, cuprite; cryptomelane, pyrolusite; minor pyrite,
galena
GENERAL ANALYTICAL DATA.....Average grade of ore mined 1886-1947: 4.8%
Cu; ranged from > 8% to 3-3.5%. Other anomalous elements: 0.05-
6.0% Zn (ave. 0.8%), 0.02-0.86% Co (ave. 0.12%), minor Ag.

PRODUCTION.....L

DEPOSIT MODEL.....Basaltic Cu

USGS MODEL NUMBER.....23

DEPOSIT SIZE.....LARGE

DEPOSIT DESCRIPTION.....Thin, subhorizontal tabular ore bodies and
mantos in argillaceous tuff. Five main horizons, each underlain by
tuff conglomerate or equivalent arenaceous tuff bed. Ore horizons
numbered 0, 1, 2, 3 and 4 from top to bottom. Sulfide zone ore:
finely disseminated black chalcocite associated with chalcopyrite,
bornite, covellite, native Cu and minor pyrite and galena.
Widespread but ill-defined oxide zone contains nodules (boleos) of
chrysocolla, azurite, malachite, atacamite, melaconite, cuprite,
cryptomelane and pyrolusite. Gangue consists of montmorillonite
and altered volcanic rocks crosscut by veinlets of gypsum,
calcite, chalcedony and jasper. Ore zones separated from footwall
conglomerate (or tuff) by thin layer (10-50 CM) of finely

laminated arenaceous tuff. Average thickness of ore bodies: 60-80 CM.

HOST ROCK AGE.....EPLIO
HOST ROCK TYPE.....argillaceous tuffs, tuffaceous conglomerates
GANGUE MINERALS.....montmorillonite, gypsum, calcite, chalcedony, jasper
SIGNIFICANT ALTERATION.....argillic

ORE MATERIALS.....pyrolusite, psilomelane, hollandite, ramsdellite, manganite, wad, (bustamite), (rhodonite); (vanadinite)

GENERAL ANALYTICAL DATA.....43.38-55.81% Mn (Gonzalez, 1956.)

PRODUCTION.....S

EXPLORATION AND DEVELOPMENT COMMENTS.....Ore shipped during WW1 and WW2. In 1942, property taken over by Cia. Mexicana de Manganeso, S.A. In 1944, a 1200-ton mill was installed and attempt was made at large scale mining of low grade Mn ores. Project abandoned in 1948 due to unsatisfactory results.

DEPOSIT MODEL.....Epithermal Mn

USGS MODEL NUMBER.....25g

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Veins and veinlets of Mn oxides cutting hornblende andesites (Gonzalez, 1956) and/or basalt members of the Comondu volcanics (Wilson, 1956.) Principal veins range from 10-50 CM in width. Most are veinlets only 1-10 CM wide. Ave strike: N 20-25 W with dip of 50-70 SW. A less prominent system of veinlets

strikes N 50 W to due W and dips 50-70 NE to N. Veinlets tend to reticulate along both strike and dip. Spacing between veinlets ranges from a fraction of a meter up to 2-3 meters. Irregular secondary enrichment zone at surface of outcrops contains numerous veinlets of Mn minerals. Economically exploitable ores consist of oxides, mainly psilomelane and pyrolusite, with lesser amounts of manganite and wad. Mn-silicates known to occur include bustamite, found in two open cuts and pockets of rhodonite, manganite and pyrolusite at Cata Luisita. Hollandite and ramsdellite also reported. Gangue minerals include: gypsum, quartz, rare calcite and dolomite, aragonite, hematite and limonite. Epidote occurs in altered exfoliation layers capping andesites. Crystals of vanadinite occur in one locality.

HOST ROCK TYPE.....hornblende andesite and/or olivine basalt
 IGNEOUS ROCK AGE.....MIO
 IGNEOUS ROCK TYPE.....hornblende andesite, olivine basalt
 GANGUE MINERALS.....gypsum, quartz, rare calcite and dolomite,
 aragonite, hematite, limonite, epidote

ORE MATERIALS.....antimony oxide, stibnite
EXPLORATION AND DEVELOPMENT COMMENTS.....One of the most productive
 mines in the district from about 1925-1935. Inactive in 1943.
DEPOSIT MODEL.....Simple Sb
USGS MODEL NUMBER.....27d
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Sb vein deposit, either two separate veins
 or single vein with 12 M offset near central part. Known strike
 length: 200 M. Vein strikes N 45-70 E. On the west side of arroyo,
 vein dips 85 N and consists of 30 CM of brecciated and altered

wall rock with about 10 CM of low-grade Sb ore along hanging wall. Vein dips 75-85 S on east side of arroyo. In the middle and lower parts of the deposit, the dip of the vein flattens to the N and ore said to be 3 M wide along large part of the vein. Ore mostly oxidized to deepest levels of the mine, but about 4 tons of unoxidized stibnite ore was mined from below the second level. Vein was mined to a depth of 35-40 M.

SITE NAME.....Las Laminas

STATE.....SONORA

LATITUDE.....30-27-45N LONGITUDE.....110-34-45W

COMMODITIES.....AU AG

MAIN...AU AG

ORE MATERIALS.....gold; malachite, azurite, minor oxidized
pyrite

GENERAL ANALYTICAL DATA.....0.8 g/MT Au, 15 g/MT Ag.

DEPOSIT MODEL.....Flat-Fault Au(?)

USGS MODEL NUMBER.....37b?

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Gold-silver mineralization in diorite
along low-angle fault zone containing abundant limonite and
hematite. Zone has exposed thickness of 5 m. Irregular cm-scale
quartz and carbonate veins and pods of brecciated quartz up to 0.5
m in width occur along fault zone. Several large hematite stained
and brecciated quartz veins occur along low-angle shears in
hanging wall.

HOST ROCK AGE.....JUR

HOST ROCK TYPE.....diorite

IGNEOUS ROCK AGE.....JUR

IGNEOUS ROCK TYPE.....diorite

GANGUE MINERALS.....quartz, carbonate, hematite, limonite

SIGNIFICANT ALTERATION.....Chloritic alteration in diorite, sericitic
alteration and silicification along contact zone.

REFERENCE...Silberman, Staude and Cox, 1987.

 PRODUCTION.....S
 EXPLORATION AND DEVELOPMENT COMMENTS.....Disc. and mined during WW1
 (produced 4,000 units tungstate). Reopened for seven years
 starting in 1937 (60,000 units produced).
 DEPOSIT MODEL.....W Skarn
 USGS MODEL NUMBER.....14a
 DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Scheelite in tactite; mainly garnet, but locally idocrase, axinite, diopside, quartz, or calcite predominates. Small % of ore is in quartz diorite containing minor calc-silicates. Minor Fe-oxides and secondary Cu minerals in weathered portions. Sulfides (pyrite, pyrrhotite, chalcopyrite and arsenopyrite occur in fresh rock. A few pegmatite dikes contain minor diss scheelite along contacts with ore bodies. Main ore body is fan-shaped tactite zone at contact between marble and main diorite body. Length of scheelite-bearing zone at surface: 185 M. Length of commercial ore body (greater than 0.4% WO₃ material): 120 M. Sides of ore body appear to converge toward a point immediately below the bottom of the 93-M shaft, where ore body is only 4-5 M long and 3 M wide. Width in upper workings varies from 0.2 to 17.0 M (ave. 4.0 M). Best ore was in pockets or lenses. Some ore mined from irregular vein-like masses extending into marble. Possibly another fan-like ore body at N end of mine, where ore has been stoped from 200-FT level; ore zone less than 1.0 M wide.

DEPOSIT MODEL.....W Pegmatite

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Three discontinuous parallel pegmatite dikes strike N and form low steep-sided ridges separated by narrow gravel-floored washes. At west end of claim quartzite caps mesa a few M above level of mineralized dikes. Pegmatites composed of feldspar, quartz, epidote, amphibole, muscovite, scheelite and magnetite, all med. grained. Numerous vugs lined with coarse intergrown crystals of quartz, feldspar and scheelite. Some scheelite present in soil mantle on hillsides below outcrops and in scattered throughout gravel of the arroyos, but richest concentration is in a thin layer a few CM just above bedrock at the base of the gravel. Gravel is up to 2 M thick at the center of the channel. Pegmatite lenses too small and discontinuous to be mined profitably on a large scale.

HOST ROCK TYPE.....pegmatite

PRODUCTION.....U
EXPLORATION AND DEVELOPMENT COMMENTS.....The three claims of the La Paz Group were located in 1943 on the western extension of the abandoned Realito copper property.
DEPOSIT MODEL.....Polymetallic Vein
USGS MODEL NUMBER.....22c
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Series of NE striking, vertically dipping replacement veins in granite. Veins consist of quartz, calcite, pyrite and scheelite. Assays showed presence of minor amounts of gold in one shoot, barite found in another, not associated with scheelite. The Realito mine, on the same veins 300 FT east of La Paz Group, produced chalcopyrite and gold in a gangue of magnetite, pyrite, specularite and very little quartz. No feldspar, mica or chlorite were noted in veins on either property.
HOST ROCK TYPE.....granite

ORE MATERIALS.....scheelite, chalcopyrite, chalcocite, molybdenite, powellite, unknown Au-Ag

GENERAL ANALYTICAL DATA.....Tungsten ore shoots contain 2.0% WO₃, 1.0% MoS₂ and as much as 6.0% Cu. In the remainder of the veins, assays indicated 0.1-0.5% WO₃, 0.1-1.0% MoS₂ and up to 12.0% Cu.

PRODUCTION.....S

EXPLORATION AND DEVELOPMENT COMMENTS.....Property first worked in 1910 for gold, silver and copper. In 1923 the International Minerals Syndicate did exploratory work. Additional expl. work by Penoles Co. in 1937. Scheelite not recognized until 1942. In 1943, the American Smelting and Refining Co. purchased the property from W. C. Taylor, Jr. and was engaged in underground exploratory work.

DEPOSIT MODEL.....Polymetallic Vein

USGS MODEL NUMBER.....22c

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Group of subparallel, locally branching veins form a zone 15 M wide and 230 M long. Individual veins are from a few CM to 2 M wide and ave. about 1 M in width. In the veins, granite has been replaced by scheelite, chalcopyrite, pyrite and molybdenite in a gangue of quartz and calcite. Some pyrite and chalcopyrite disseminated through granite for several M away from the veins. Thin stringers and disseminated crystals of scheelite scattered through most of the veins, but are most prominent in two shoots at the SW end of the ore zone.

HOST ROCK TYPE.....granite

IGNEOUS ROCK AGE.....CRET?

IGNEOUS ROCK TYPE.....granite

GANGUE MINERALS.....quartz, calcite, pyrite

SIGNIFICANT ALTERATION.....Secondary oxides prominent in upper 40 FT of the veins.

REFERENCES

Radelli, 1985.

Wiese and Cardenas, 1945.

PRODUCTION COMMENTS.....Some scheelite mined from shallow pits in bedrock, but most taken from adjacent washes.

SOURCE OF PRODUCTION INFORMATION.....Wiese and Cardenas, 1945.

RESOURCES COMMENTS.....The two known tungsten shoots probably extend from the 21-meter level to at least 10 M below the 45-meter level and may contain as much as 4,000 tons of ore. Tungsten mineralization on the 43-meter level is strong and may continue considerably deeper than now exposed (in 1945).

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....At La Argentina, six main veins nearly parallel to purple-gray arenite and limonite. Eastern vein, 280 M long and from 10 CM to 2 M in width, has been most productive in the district. Middle part of eastern vein thins to 10-20 CM and contains 0.5-15 CM of low-grade ore along hanging wall. Middle and western veins, generally 20-40 CM wide, are cut by several premineral faults. Silver mineral, either Ag bromide or mixed bromide and chloride, occurs as coating on walls of fractures.

HOST ROCK AGE.....TRI
 HOST ROCK TYPE.....purple-gray sandstone and siltstone

GENERAL ANALYTICAL DATA.....Highest grade sample: 0.5 g/MT.

DEPOSIT MODEL.....Flat-Fault Au(?)

USGS MODEL NUMBER.....37b?

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Minor gold-silver mineralization in quartz-feldspar gneiss with thin, discontinuous quartz veins. Intensely fractured and hematite stained metavolcanic bedrock overridden by thrust sheet of metasedimentary rocks.

HOST ROCK AGE.....PREC

HOST ROCK TYPE.....gneiss

GANGUE MINERALS.....quartz, hematite

SIGNIFICANT ALTERATION.....Sericitic and chloritic alteration along veins.

COMMODITIES.....AU AG

MAJOR.....AU AG

GENERAL ANALYTICAL DATA.....3-15 g/MT Au, 200 g/MT Ag, (Perez Segura, 1985). Silberman and others report 46 g/MT Au in one sample of tourmaline-quartz vein, and approx. 1 g/MT Au in altered granite with thin quartz-tourmaline veinlets, (Silberman, Giles, and Graubard-Smith, 1987).

PRODUCTION.....S

DEPOSIT MODEL.....Flat-Fault Au(?)

USGS MODEL NUMBER.....37b?

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Gold-silver values in a system of steep-dipping tourmaline-bearing quartz veins and veinlets hosted in fractured and sericitically altered Precambrian granite over 300 by 300 meter area. Gold values attaining 15 G/MT have been mined to 60 M depth on one of the stronger structures. Area overlies low-angle structure containing a large quartz vein.

HOST ROCK AGE.....PREC

HOST ROCK TYPE.....granite

IGNEOUS ROCK AGE.....PREC

IGNEOUS ROCK TYPE.....granite

SIGNIFICANT ALTERATION.....Sericitic.

 ORE MATERIALS.....gold, scheelite
 GENERAL ANALYTICAL DATA.....Highest assay of a reliable sample of the
 bar nearest Nacimiento gave 0.1% WO₃ and 2.00 pesos (1943 price)
 of gold/CM, but this content was several times the average value.
 PRODUCTION.....S
 EXPLORATION AND DEVELOPMENT COMMENTS.....River bars worked
 intermittently by gambusinos for many years.
 DEPOSIT MODEL.....Placer Au-W
 USGS MODEL NUMBER.....39
 DEPOSIT SIZE.....SMALL
 DEPOSIT DESCRIPTION.....Recent gravel bars on both side of the
 channel of Yaqui R. from Nacimiento downstream for several KM
 known to contain gold and scheelite. The bars are at least 10 M
 thick locally and could contain as much as 1,000,000 CM of gravel
 + sand. Joints in granite bedrock makes surface very uneven and
 there are numerous large boulders in gravels that would hamper any
 dredging operations. Gold values consistent in the bars, but
 scheelite content decreases downstream from Nacimiento.

PRODUCTION.....S
EXPLORATION AND DEVELOPMENT COMMENTS.....Explored by EM and
 gravimetric methods.
DEPOSIT MODEL.....Zn-Pb Skarn
USGS MODEL NUMBER.....18c
DEPOSIT SIZE.....MEDIUM
DEPOSIT DESCRIPTION.....Cu-Zn-Ag mineralization in skarn
 associated with quartz monzonite porphyry. Three tactite beds
 separated by quartzite. Strike: N 50 W, changes to N 30 W to the
 SE due to fault. Dip: 60-90 NE. Ore consists of scheelite, pyrite,
 sphalerite, marcasite and chalcopyrite with minor amounts of
 galena, pyrrhotite, molybdenite, cubanite, native Bi,
 bismuthinite, mackinawite and hematite. Hosted in garnet-diopside-
 vesuvianite skarn with late-stage hydrothermal biotite-chlorite-
 quartz-calcite assemblage. Supergene covellite present.
 Gravimetric survey (@1978) indicated high-density zone that was
 later drilled. Two dd-holes intercepted 23 M section of tactite
 intercalated with quartzite. Drill holes indicated metallic
 content of 15% pyrite + pyrrhotite + magnetite and defined a 3 M
 thick zone containing 10% sphalerite.

 (Scherkenbach, et.al., 1985).
PRODUCTION.....M
EXPLORATION AND DEVELOPMENT COMMENTS.....Became Mexico's first
 major producing Mo mine in Aug. 1980.
DEPOSIT MODEL.....Porphyry Cu-Mo
USGS MODEL NUMBER.....21a
DEPOSIT SIZE.....MEDIUM
DEPOSIT DESCRIPTION.....Mo-Cu mineralization localized in
 pegmatitic breccias and in collapse-type breccias along borders of
 intrusive. At least 35 breccia bodies in 12 SQ KM area. Ore grade
 mineralization restricted to a few centrally located bodies and
 associated stockworks. Known mineralized breccias have irregular,
 elongate shapes, ranging from a few M to more than 300 M in
 longest horizontal dimension. Depths to more than 400 M. Bodies
 pinch and swell vertically. Breccias have diverse characteristics-
 in clast size, angularity, degree of brecciation, gradational vs.
 abrupt contacts, etc. Breccias coincide with fingerlike

projections of potassic alteration within large propylitic zone. Crosscut by dominantly fracture controlled zones of sericitic alteration with pockets of argillic alteration. Distal, unmineralized breccias exhibit strong sericitization and tourmalinization. Two stages of post-brecciation alteration and mineralization: 1> potassic alteration and deposition of molybdenite-pyrite-quartz assemblage; 2> quartz-sericite alteration and replacement of pyrite by chalcopyrite + tetrahedrite.

 ORE MATERIALS.....sphalerite, galena, chalcopyrite, minor
 argentiferous tetrahedrite-tennantite; rhodonite, rhodochrosite,
 bustamite
 GENERAL ANALYTICAL DATA.....See Prod/Resv. Low-grade interlaminae in
 fine crystal tuff: 0.2-1.0% Pb, 0.2-3.0% Zn, anom. Ag, v.low Cu
 (2-8 ppm). 1.5 ppm Au detected in thick (0.5 M) interbeds of
 magnetite assoc. with semi-massive ore.
 PRODUCTION.....S
 EXPLORATION AND DEVELOPMENT COMMENTS.....Small-scale mining
 intermittently since the 1920's. Acquired by Anaconda in late
 1940's. Joint venture formed in 1975 between Anaconda and Sevicios
 Industriales Penoles, S.A. to explore the deposit.
 DEPOSIT MODEL.....Kuroko Massive Sulfide

USGS MODEL NUMBER.....28a
 DEPOSIT SIZE.....MEDIUM
 DEPOSIT DESCRIPTION.....Four main types of mineralization: 1> sphalerite-galena-pyrite-chalcopyrite massive (90%) sulfide horizons, trace Ag-bearing tetrahedrite-tennantite, 20% of ore; 2> bedded semi-massive (20-50%) sphalerite-galena-pyrite interbedded with chlorite-epidote layers, beds 2-20 mm thick with local interbeds of magnetite 1-4 mm thick (max: 0.5 M), 60% of ore; 3> galena-sphalerite-chalcopyrite-pyrite replacing massive, thinly laminated, or brecciated limestone, assoc. with rhodonite, rhodochrosite and bustamite, 10-20% of ore; 4> thin layers of v. fine gr. low-grade galena-sphalerite-pyrite interlaminated with fine crystal lithic tuff layers of the Candelaria Lithic Tuff, assoc. with weakly calcareous Mn-oxide layers. Massive sulfide bodies are stratiform, lenticular to podiform in outline, and grade laterally into semi-massive and thinly bedded sulfides. Largest massive orebody: 100 M x 250 M, 0.5-3.5 M thick. 1-3 thinner, less extensive horizons occur stratigraphically above main body.

ORE MATERIALS.....scheelite, molybdenite
DEPOSIT MODEL.....W Pegmatite
DEPOSIT SIZE.....MEDIUM

DEPOSIT DESCRIPTION.....Numerous scheelite occurrences over 10-20 sq. KM area. Scheelite in disseminated crystals, coating joints and in quartz-calcite stringers cutting monzogranite adjacent to silicified fault zones. Crystals of scheelite (+/- molybdenite) disseminated in aplites and quartz dikes cutting greisenized portions of granite. Veinlets, pods and stringers of scheelite occur in greisen along a ridge about 300 M long and 100-150 M wide. High-grade lenses of coarsely crystalline scheelite occur in pegmatitic phase of granite, associated with quartz, beryl, tourmaline and oxidized pyrite.

HOST ROCK TYPE.....pegmatite, biotite-hornblende monzogranite, aplite

IGNEOUS ROCK AGE.....LCRET-ETERT

IGNEOUS ROCK TYPE.....granitic intrusives

GANGUE MINERALS.....quartz, calcite, muscovite, perthite, tourmaline, beryl, pyrite

DEPOSIT MODEL.....Simple Sb

USGS MODEL NUMBER.....27d

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Widest and most persistent vein in district. Known strike length: 250 M. Probable total strike length of 500 M. Average width: 60 CM. Vein consists of coarse-grained milky quartz containing antimony oxide. Average recorded dips on the three mine levels, from upper to lower: 68, 74 and 64 degrees. Three largest ore bodies situated along portions of the vein where dip flattens out. Dip changes corresponding to these ore bodies are: change from 88 N on intermediate level to 75 S at the surface; flattening of dip from 72 on the middle part of the lower level to 66 at a distance of 6 M below the level; dip change from

53 in the upper part of the lower level stope to 43 in the middle and 55 in the lowest portion. Max. width of vein in stope: 1.8 M. About 35 CM of ore generally found along hanging wall and 10-20 CM in the middle and footwall portions of the vein. Much of the quartz is gold-bearing.

ORE MATERIALS.....antimony oxides
GENERAL ANALYTICAL DATA.....Large ore body N of main shaft contained an average of 20% Sb; most of the ore bodies contained 5-15% Sb.
PRODUCTION.....M

EXPLORATION AND DEVELOPMENT COMMENTS.....Vein discovered, 1936.
First ore body not found until 1941 or 1942. In 1943, became
largest producer in the district, producing 2-3 tons of high-grade
ore and about 8 tons of low-grade milling ore per day.

DEPOSIT MODEL.....Simple Sb

USGS MODEL NUMBER.....27d

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Veins strike N 45-90 E and dip 20-50 S;
generally cut across bedding of wall rocks, locally at large
angles. Veins consist mainly of chalcedony with higher antimony
oxide content and lower proportion of coarse-grained quartz than
any other mine in the district. High-grade bodies of yellow to
cream-colored antimony oxide ore are generally surrounded by low-
grade intermixtures of chalcedony and olive-green antimony oxide.
High-grade bodies of antimony oxide ore contain small disseminated
euhedral quartz crystals and irregular veinlets and masses of
chalcedony that apparently replaced the ore minerals.

HOST ROCK AGE.....TRI

HOST ROCK TYPE.....red and gray siltstone, purple sandstone

GANGUE MINERALS.....chalcedony, quartz

SIGNIFICANT ALTERATION.....Siltstone and sandstone leached to white
kaolinite and sand in zone extending 60-70 CM from vein walls.

REFERENCE....White and Guiza, 1949.

ORE MATERIALS.....pyrite, chalcocite, covellite,
 chalcopyrite, molybdenite, digenite, sphalerite, galena, bornite,
 cubanite, tennantite
GENERAL ANALYTICAL DATA.....Hypogene ore: 0.3% Cu, 0.01-0.04% Mo,
 Supergene ore: 0.75% Cu, (Saegart, et.al., 1974); Head grades
 (run-of-mine): 0.6-0.8% Cu, 0.02-0.04% Mo, (Mining Magazine,
 1987).
PRODUCTION.....M
EXPLORATION AND DEVELOPMENT COMMENTS.....El Tajo copper smelter
 commissioned, June, 1986. Capacity: 180,000 st/y. Produces blister
 copper (99.6% Cu) cast into anodes.
DEPOSIT MODEL.....Porphyry Cu-Mo
USGS MODEL NUMBER.....21a
DEPOSIT SIZE.....LARGE
DEPOSIT DESCRIPTION.....Dominant economic copper mineral is
 chalcocite (+ covellite) in blanket-like enrichment zone with ave.
 diameter of 1700 M and ave. thickness of 90 M (max: 250 M).
 Chalcocite layer occurs beneath an oxidized leached cap, ave. 50 M
 thick, composed mainly of hematite + goethite + jarosite. Primary
 sulfides (2-3% by volume) occur as fracture-fillings,
 disseminations and breccia matrix replacements. Dominantly pyrite
 and chalcopyrite, with lesser amounts of molybdenite, bornite,
 sphalerite and galena. Primary mineralization contemporaneous with
 alteration. In the center of the deposit the ratio of pyrite to
 chalcopyrite is 2:1 while at the distal edges it is 10:1.
 Chalcopyrite, bornite, cubanite and molybdenite are solely

hypogene in origin and chalcocite, covellite and digenite are supergene. La Caridad Vieja: Pyrite-tennantite-bornite-chalcocite-quartz-barite vein in Laramide-age quartz porphyry and volcanic rocks.

HOST ROCK AGE.....LCRET-ETERT

HOST ROCK TYPE.....quartz monzonite, quartz diorite, latite porphyry, pegmatite

IGNEOUS ROCK AGE.....EO

(53.0 +/- 0.4 M.Y., sericite in quartz monzonite)

(52.5 +/- 1.3 M.Y., latite porphyry)

(54.3 +/- 1.2 M.Y., biotite in quartz monzonite)

(50.0 +/- 1.2 M.Y., quartz diorite)

IGNEOUS ROCK TYPE.....quartz diorite, quartz monzonite, latite porphyry, volcanic rocks

GANGUE MINERALS.....quartz, barite, sericite, pyrite

SIGNIFICANT ALTERATION.....Pervasive phyllic alteration grades outward into poorly defined argillic zone, enveloped by thin band of propylitic alteration. Leached cap indicates that main economic copper mineralization was secondary. Local tourmalinization. No significant potassic alteration.

 along best mineralized section. Ave. width: 30 CM. Attitude: N 45
 W, 61 NE; changes strike to N 66 W at foot of Cerro de La Azteca.
 Ore has banded structure. Ore minerals: pyrolusite, psilomelane,
 manganite and wad. Rhodochrosite, bustamite and rhodonite known to
 occur. Gangue: calcite, gypsum, quartz, epidote and rare Cu-
 carbonates.
 HOST ROCK TYPE.....hornblende andesite
 IGNEOUS ROCK AGE.....MIO
 IGNEOUS ROCK TYPE.....hornblende andesite
 GANGUE MINERALS.....calcite, gypsum, quartz, epidote, rare Cu-
 carbonates

 LATITUDE.....32-29- N LONGITUDE.....116-15- W
 COMMODITIES.....MN GRF
 MAIN...MN MINOR...GRF
 ORE MATERIALS.....pyrolusite, psilomelane, minor braunite,
 graphite
 GENERAL ANALYTICAL DATA.....Composite sample of Mn vein: 16.56% Mn,
 59.95% silica, 1.67% C, 1.10% Pb, trace Cu, 0.10% Zn, 6.00% Al,
 3.11% Fe; Composite sample of graphite lenses: 10.70% C.
 DEPOSIT MODEL.....Not Classified
 DEPOSIT SIZE.....SMALL
 DEPOSIT DESCRIPTION.....Mn-graphite vein in muscovite schist. 1.5
 to 5.0 M wide. Ave: 2.5 M. Outcrops traceable for 600 M along
 strike. Vein follows schistosity: N 10 E to N 15 W, 63-72 W.
 Mineralization consists of pyrolusite, psilomelane and minor
 braunite associated with finely disseminated graphite. Mn oxides
 form a thin film on crystals of quartz, ferromagnesian minerals
 and garnets. Lenses of massive graphite up to 1 M wide occur along
 hanging-wall of vein, associated with a thin (2 CM) bed of
 ferruginous sandstone.
 HOST ROCK AGE.....TRI?

HOST ROCK TYPE.....muscovite schist with intercalated
quartzite, recrystallized limestone, ferruginous sandstone and
amphibolite breccia

IGNEOUS ROCK AGE.....LJUR?

IGNEOUS ROCK TYPE.....hornblende granite

GANGUE MINERALS.....quartz, amphibole, garnet

REFERENCE....Mapes-Vasquez, 1956.

GENERAL ANALYTICAL DATA.....Ave: 3.36-4.30 g/cc.

DEPOSIT MODEL.....Bedded Barite

USGS MODEL NUMBER.....31b

DEPOSIT SIZE.....MEDIUM

DEPOSIT DESCRIPTION.....Channelized barite turbidites of inner to middle fan facies. Mainly Pennsylvanian turbidites at least partly composed of reworked Devonian barite turbidites. Some conformable Devonian barite horizons, 0.05-15 meters thick, in Ord-Miss sedimentary sequence. Barite occurs in massive layers, "alternating-type" ore consisting of barite interlayered with shale and chert horizons, and nodules. (R.J. Madrid, writ. comm., Feb., 1987)

 PRODUCTION.....L
 EXPLORATION AND DEVELOPMENT COMMENTS.....Breccia pipe discovered:
 1926.
 DEPOSIT MODEL.....Porphyry Cu-Mo
 USGS MODEL NUMBER.....21a
 DEPOSIT SIZE.....MEDIUM
 DEPOSIT DESCRIPTION.....High-grade breccia pipe and disseminated
 supergene Cu-ore associated with NW-trending series of quartz
 monzonite porphyry intrusives in Mesa Volcanics. High-grade Cu ore
 enclosed in pegmatitic quartz-phlogopite sheath within collapse
 breccia near the apex of a quartz porphyry plug. Massive
 molybdenite-chalcopryrite-chalcocite ore formed ring within quartz
 shell, with pyrite zoned peripherally and in overlying quartz
 veinlets. Low-grade quartz-chalcopryrite-molybdenite veinlets
 extended downwards at least 500 M below pipe. Late stage
 mineralization consisted of pyrite-alunite veins with luzonite-
 tennantite-covellite-sphalerite-galena assemblage formed within
 the massive sulfide ring concurrent with brecciation of the early
 sulfide ore. Top of pipe: 200 M below surface.
 HOST ROCK AGE.....CRET

PRODUCTION.....S
EXPLORATION AND DEVELOPMENT COMMENTS.....Active during WW1, WW2 and
1950-1954.
DEPOSIT MODEL.....Epithermal Mn
USGS MODEL NUMBER.....25g
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Mn oxide ore in well-defined steep-dipping
fissure veins in Tertiary volcanic rocks and brecciated zones. At
least 15 "exploitable" veins along two main fracture systems
running NS and EW. Strike lengths up to 830 M, ave. 50-200 M. Ave.
thickness: 1.0-1.5 M, max. 2-3 M. Depth to bottom: @50 M. (Smaller
veins, 10-30 CM wide, not considered economic.) Veins consist of
@50% psilomelane plus "black calcite" containing finely
disseminated Mn oxides and 50% white calcite. Veins have banded
structure and commonly contain vugs lined with calcite crystals.
Also: brecciated zones containing Mn oxides cementing fragments of
volcanic rocks, generally along hanging-walls of veins.
Paragenesis: 1> black calcite, 2> psilomelane, 3> white calcite.

GENERAL ANALYTICAL DATA.....Ave. grade: 10.7 oz/MT Ag, 8.4% Pb, 7.2%
Zn, (Maldonado and Megaw, 1983); Oxidized ores: 15 oz Ag/ton,
Sulfide ores: 4.2 oz Ag/ton, 3.1% Zn, 0.2% Cu, (MINOBRAS, 1984).
PRODUCTION.....L

EXPLORATION AND DEVELOPMENT COMMENTS.....Discovered @1591 but no
denouncements or production recorded until 1707. Oxidized Ag-rich
ore bodies mined by Spanish Colonial operators, 1707-1790.
District relatively inactive, 1790-1880. Potosi Mining Co. (now
Minerales Nacionales de Mexico) and ASARCO MEXICANA (now
Industrial Minera Mexico) entered district in 1880. First
selective flotation plant built in 1925. Sulfide ore production,
1925-present.

DEPOSIT MODEL.....Polymetallic Replacement
DEPOSIT SIZE.....LARGE
DEPOSIT DESCRIPTION.....District consists of two main mineralized
zones: the East Camp (San Antonio Mine) and the West Camp (Buena
Tierra and El Potosi Mines). The two areas are separated by @6 KM
of apparently barren ground. Mineralization is dominantly in the
form of manto and chimney replacement bodies in limestone, with
significant skarn ores in the East Camp. West Camp orebodies occur
in a gently warped zone over a vertical distance of 1000 M. See
record numbers MX02213 and MX02214.

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Erupcion-Ahumada manto: continuous pipe-like ore body in lower part of Los Lamentos Fm. Ore body dips 14 degrees N, parallel to bedding. Upper portions of the pipe (Erupcion Mine) measured 10 M X 50 M in cross section and consisted of massive and disseminated anglesite +/- gypsum and sulfur. Masses of high-grade anglesite contained up to 65% Pb. Large bodies of plumbojarosite assaying 19% Pb were also found. In the lower portions of the ore body (Ahumada Mine) the ore consisted of hematite + cerussite (ave. 30% Pb) with minor wulfenite, vanadinite and descloizite and rare residual masses of galena. Several stopes consisted of spongy masses of vanadinite needles in ore containing 65% Pb and 12% vanadium oxide. Zn minerals present include willemite, hydrozincite and one occurrence of sphalerite + pyrite. One specimen of brochantite (hydrous copper sulfate) was found.

HOST ROCK AGE.....CRET

HOST ROCK TYPE.....dolomitized limestone

GANGUE MINERALS.....calcite, dolomite, gypsum, native sulfur, Fe-oxides

ORE MATERIALS.....carnotite, metayuyamunite, uranophane;
 garnierite
GENERAL ANALYTICAL DATA.....Mineralized samples contained: 320-27000
 ppm U, 10-320 ppm Th; one sample with garnierite ran 1.70% Ni;
 possibly significant values of Mo and V also found.
DEPOSIT MODEL.....Carbonate-Hosted U
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Disseminated hexavalent U minerals in
 breccia zones along thrust faults in massive limestone. U
 mineralization associated with Fe-oxides and calcite +/- fluorite.
 U minerals also found in silicified and iron-enriched collapse

breccia associated with paleokarst features in limestone. Zonation in collapse breccia consists of loosely cemented limestone breccia core, surrounded by thin (5 CM) garnierite-calcite zone and outer zone of purple fluorite (0.5 CM).

HOST ROCK AGE.....CRET (MIDDLE ALBIAN)
HOST ROCK TYPE.....thin bedded calcareous mudstone and wackestone
GANGUE MINERALS.....calcite, pyrite, chalcedony, fluorite, selenite

 OCCUR.....NB
ORE MATERIALS.....silver-rich oxide ore, sphalerite, galena,
 chalcopyrite, cassiterite, vanadium-bearing silicates, wolframite,
 columbite
GENERAL ANALYTICAL DATA.....10.7 oz/MT Ag, 8.4% Pb, 7.2% Zn (district
 averages); San Antonio Tin Chimney stopes averaged 1.5% Sn with

max. values up to 4-5%. Assays from different parts of the mine showed 0.23-0.50% V.

PRODUCTION.....L
EXPLORATION AND DEVELOPMENT COMMENTS.....Early production (prior to @ 1925) came from oxidized ores. Later mining exploited sulfide ores. Major tin ore bodies were mined out by the early 1940's.
DEPOSIT MODEL.....Polymetallic Replacement
USGS MODEL NUMBER.....19a
DEPOSIT SIZE.....LARGE
DEPOSIT DESCRIPTION.....Mineralization dominantly in the form of a tabular calc-silicate, Zn-rich chimney that is zoned across the San Antonio Dike from a skarn assemblage to a massive sulfide. Chimney is crosscut by smaller Pb-rich mantos of lesser economic importance. Skarn silicates are zoned in relation to the dike, grading from a narrow epidote-chlorite-fluorite zone adjacent to the dike outward into an actinolite rich (+/- grossular) zone, which in turn grades outward into a grossular-rich (+/- actinolite) zone. Silicates locally grade into massive sulfide ores, but may show sharp outer contacts with limestone. Silicate bodies contain economic amounts of sphalerite, galena, pyrite and minor amounts of chalcopyrite and arsenopyrite. Massive sulfide chimneys composed of sphalerite and pyrite and mantos consisting of galena and pyrrhotite with sphalerite, both occur locally outside of the silicate zones. Several tin-chimneys and vein replacement lodes also occur on upper levels of the mine. Major tin body was a chimney over 300 M in vertical extent adjacent to the San Antonio Dike. Mineral assemblage consisted of cassiterite associated with specularite, quartz, topaz, fluorite, magnetite, tourmaline and wolframite. Significant amounts of vanadium associated with oxidized silicate ore.
HOST ROCK AGE.....CRET
HOST ROCK TYPE.....limestone
IGNEOUS ROCK AGE.....TERT
IGNEOUS ROCK TYPE.....felsite
GANGUE MINERALS.....Primary minerals at San Antonio mine (not including ore minerals): pyrite, pyrrhotite, arsenopyrite, magnetite, ilmenite, hematite, quartz, garnet, epidote, hedenbergite(?), tremolite, actinolite, idocrase(?), ilvaite, scapolite, topaz, tourmaline, orthoclase, muscovite, fluorite.
SIGNIFICANT ALTERATION.....Contact between limestone and silicate or sulfide bodies generally sharp. Limestone often exhibits a 1 CM thick bleached and recrystallized selvage.

ORE MATERIALS.....argentiferous(?) galena, sphalerite;
chalcopyrite; native silver, pyrargyrite
GENERAL ANALYTICAL DATA.....1> sulfide ore: 230 g/MT Ag, 12% Pb, 11%
Zn, 30% Fe. 2> silicate ore: 50-150 g/MT Ag, 0.8-1.6% Pb, 1.4-1.6%
Zn. 3> oxide ore: 495-5320 g/MT Ag, 0.8-3.1% Pb, 1.8-3.0% Zn, 7.3-
11.9% Fe, 31.2% Mn; Hewitt (1968), p.253-254.
PRODUCTION.....L
DEPOSIT MODEL.....Polymetallic Replacement
USGS MODEL NUMBER.....19a
DEPOSIT SIZE.....LARGE
DEPOSIT DESCRIPTION.....Mineralization is dominantly in the form
of manto and chimney deposits localized by a complex interplay of
lithology, structure and intrusive bodies. Three major types of
ore mineralization are present: 1> "normal" sulfide ores composed
of pyrite, pyrrhotite, sphalerite and galena with sparse
chalcopyrite and arsenopyrite; mantos are Pb-Ag-rich and chimneys
are Zn-rich. 2> small irregular silicate bodies, scattered
throughout higher levels of the mine area, composed of fayalite,
ilvaite, magnetite and knebelite and containing economic amounts
of galena and sphalerite. The silicate bodies bear no zonal
relationship to the sulfide ores. 3> oxide ores consisting of
massive oxides and carbonates of Pb, Zn and Fe. These were
exploited mainly in the early days of the district. The ores are
Mn-rich and have a calcite gangue. A fourth, less important, type
of ore currently (1983) mined in the northern part of the El
Potosi area consists of highly manganiferous limestone with finely
disseminated native silver and pyrargyrite. This material averages
2.5 oz/MT Ag and is used as a smelter flux.
HOST ROCK AGE.....CRET
HOST ROCK TYPE.....limestone
IGNEOUS ROCK AGE.....TERT
(26.6 M.Y., felsite; Date suspect due to alteration)
IGNEOUS ROCK TYPE.....felsite and diabase dikes and sills;
quartz monzonite pluton
GANGUE MINERALS.....pyrite, pyrrhotite, arsenopyrite, quartz,
calcite, gypsum, limonite, Mn-oxides, fayalite, ilvaite,
magnetite, knebelite, fluorite
SIGNIFICANT ALTERATION.....Alteration is very limited. Narrow zones
of silicification, bleaching, recrystallization and some minor
zones of hydrothermal dolomite.

 native copper, stibnite, cervantite, Fe and Cu sulfides, Mn oxide.
 GENERAL ANALYTICAL DATA.....120 g/ton Au, 840 g/ton Ag.
 PRODUCTION.....Y
 EXPLORATION AND DEVELOPMENT COMMENTS.....Peak activity in district:
 1905.
 DEPOSIT MODEL.....Comstock Epithermal Vein
 USGS MODEL NUMBER.....25c
 DEPOSIT SIZE.....MEDIUM
 DEPOSIT DESCRIPTION.....Au-Ag deposits in tabular veins or
 lenticular bodies. Hanging walls: andesite porphyry. Footwalls:
 slickensided shales. Deposits range in width from 12-20 M,
 averaging @ 12 M. Best ore in 2.1 M zone near hanging-wall,
 generally separated from wall rocks by 1.2-1.5 M band of low-grade
 material. Ore consists of quartz + native gold, with rare Au
 tellurides. Locally: bodies of Ag sulfides associated with
 sulfides of Pb, Cu and Fe form lenses 5-15 CM thick. Deposits also
 contain minor amounts of galena, chalcopryrite, native Cu,
 stibnite, cervantite and Mn oxide. A cylindrical chimney found in
 one mine near shale footwall consisted of rich veinlets of ore
 material in 21 M high x 10 M wide ore body.
 HOST ROCK TYPE.....shales, porphyritic andesites

COMMODITIES.....CU AG
MAJOR.....CU AG
ORE MATERIALS.....chalcopryite, chalcocite, argentite,
native Cu, azurite, malachite
GENERAL ANALYTICAL DATA.....6-9% Cu; 56-85 g/MT Ag.
DEPOSIT MODEL.....Polymetallic Replacement
USGS MODEL NUMBER.....19a
DEPOSIT SIZE.....SMALL
DEPOSIT DESCRIPTION.....Manto-type deposit in limestone.
HOST ROCK AGE.....CRET
HOST ROCK TYPE.....limestone
REFERENCE....Gonzalez R., 1956.

MRDS RECORD NUMBER....MX02275

MAP NUMBER.....2275
SITE NAME.....Terrazas
SYNONYM NAME.....Rio Tinto, Choloma, Sacramento
DISTRICT/AREA...../Chihuahua
STATE.....CHIHUAHUA
LATITUDE.....28-58-09N LONGITUDE.....106-01-33W
COMMODITIES.....CU PB AG AU
MAJOR.....CU PB MINOR.....AG AU
ORE MATERIALS.....cuprite, azurite, malachite, sub.
chalcopryite, minor native Cu, galena, cerussite
GENERAL ANALYTICAL DATA.....Skarns: 2-3% Cu, minor Au + Ag; Veins: 0.2
g/MT Au, 38 g/MT Ag, 0.19% Pb, 2.28% Cu.
PRODUCTION.....S
DEPOSIT MODEL.....Cu Skarn
USGS MODEL NUMBER.....18b
DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Cu skarns along limestone/diorite contact.
 Numerous Pb-Ag-bearing veinlets cut both rocks.
 HOST ROCK AGE.....CRET
 HOST ROCK TYPE.....limestone
 IGNEOUS ROCK AGE.....TERT?
 IGNEOUS ROCK TYPE.....diorite
 GANGUE MINERALS.....garnet

ANNUAL PRODUCTION

ITEM	TONNAGE (x10 ³)	YEAR
AU	.001 KG	1929
AG	.162 KG	1929
PB	7.740 KG	1929
CU	93.588 KG	1929

PRODUCTION COMMENTS.....Production from 4,554 MT of ore.

SOURCE OF PRODUCTION INFORMATION.....Gonzalez, 1956.

MRDS RECORD NUMBER...MX02276

MAP NUMBER.....2276

SITE NAME.....Puerto del Aire

SYNONYM NAME.....La Esperanza, La Providencia

DISTRICT/AREA...../Aldama

STATE.....CHIHUAHUA

LATITUDE.....29-07-30N LONGITUDE.....105-21-45W

COMMODITIES.....AU U

MAJOR.....AU U

ORE MATERIALS.....native gold, uraninite

DEPOSIT MODEL.....Polymetallic Vein(?)

USGS MODEL NUMBER.....22c?

DEPOSIT SIZE.....SMALL

DEPOSIT DESCRIPTION.....Five subparallel veins separated by 15-30 M, with ore bands 0.1-0.15 M wide. Typical vein (La R. vein): 0.40-1.00 M wide, average @0.70 M, with shale footwall and porphyry hanging wall, composed of calcite and quartz. Native gold associated with uraninite occurs in 10 CM band along footwall.

HOST ROCK AGE.....JUR(?)

HOST ROCK TYPE.....shale

IGNEOUS ROCK AGE.....TERT(?)

IGNEOUS ROCK TYPE.....granodiorite(?) porphyry

GANGUE MINERALS.....calcite, quartz

COMMODITIES.....AU U CU
 MAJOR.....AU U OCCUR.....CU
 ORE MATERIALS.....native gold, uraninite, pyrite, magnetite,
 (chalcopyrite)
 GENERAL ANALYTICAL DATA.....Ave. grade: 30 g/ton Au.
 PRODUCTION.....Y
 EXPLORATION AND DEVELOPMENT COMMENTS.....Major underground mining
 activity: 1887-1917.
 DEPOSIT MODEL.....Epithermal Vein
 USGS MODEL NUMBER.....25?
 DEPOSIT SIZE.....SMALL
 DEPOSIT DESCRIPTION.....Au and uraninite in quartz-calcite veins
 and stringers, NW-trending, up to 4 M wide. Porphyry hanging wall
 and shaley limestone footwall. Au and U values fluctuated with
 composition of gangue. Calcite > quartz: good values of Au and U.
 Calcite = quartz: lower grade Au-U. Quartz > calcite: Au with
 little or no U. Quartz only: barren.
 HOST ROCK AGE.....ECRET
 HOST ROCK TYPE.....shaley limestone
 IGNEOUS ROCK AGE.....TERT(?)
 IGNEOUS ROCK TYPE.....granodiorite(?) porphyry
 GANGUE MINERALS.....calcite, quartz, limonite, pyrolusite,
 malachite, uranophane
 SIGNIFICANT ALTERATION.....sericitic, kaolinitic
